Redpoint Systems Releases TL/Route© for Inventory Tracking and Mobile Business Processes

Little Rock, AR – Redpoint Systems, Inc. (RSI), a software and integration company specializing in automated data collection solutions, announces the release of TL/Route©, an inventory tracking tool for route sales and service. The software resides on handheld devices and is specifically designed to handle mobile business processes.

“T/L Route was developed in response to a market need of companies engaging in mobile based sales, delivery, service or maintenance and repair tasks,” says Mark Singleton, President of Redpoint Systems, Inc. “TL/Route integrates seamlessly to our TrakLand/2000© inventory management and operations system, making it one of the few end-to-end route accounting applications in the industry.”

The turnkey solution eliminates manual data entry for route sales and service. Rather than handwriting information upon delivery of a sale or service, then returning to host computer to key the data in, TL/Route uploads collected data directly into TrakLand/2000. The wireless support and import/export capabilities of TL/Route make it easy to maintain customer inventory, take and deliver customer orders, generate invoices and receipts, control cash, or perform service and repair work. “Increased productivity, accuracy and the availability of real-time information at the point of delivery will enhance service provided to customers of TL/Route users,” explains Singleton.

TL/Route is Microsoft® Windows Mobile™ or Windows CE® based and runs on a variety of hardware platforms. The RSI software solution also supports bar coding and mobile printing.

Years of experience and expertise in the distribution and service software industry are behind the development and support of TL/Route. “Customers can depend on our knowledgeable technicians for superior training and complete, reliable support,” says Singleton. As with all RSI products, support satisfaction for TL/Route is guaranteed. TL/Route will be available for delivery mid 3rd quarter 2003.
